# **Deep Learning**

Spring 2019

Prof. Gilles Louppe g.louppe@uliege.be

# Logistics

## This course is given by:

- Theory: Prof. Gilles Louppe (g.louppe@uliege.be)
- Projects and guidance:
  - Antoine Wehenkel (antoine.wehenkel@uliege.be)
  - Joeri Hermans (joeri.hermans@doct.uliege.be)
  - Matthia Sabatelli (m.sabatelli@uliege.be)

Feel free to contact any of us for help!

# **Lectures**

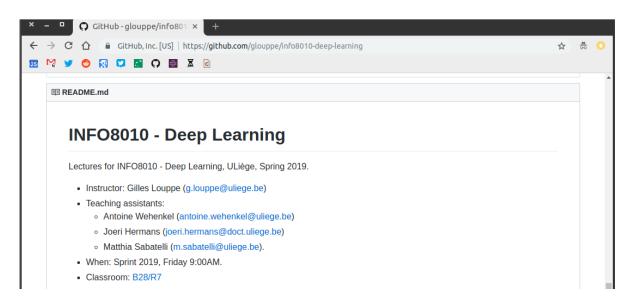

- Theoretical lectures
- Tutorials
- Q&A sessions

## **Materials**

Slides are available at github.com/glouppe/info8010-deep-learning.

- In HTML and in PDFs.
- Posted online the day before the lesson (hopefully).

Some lessons are partially adapted from "EE-559 Deep Learning" by Francois Fleuret (EPFL).

# **Textbook**

None!

# **Philosophy**

## Thorough and detailed

- Understand the landscape of deep learning.
- Be able to write from scratch, debug and run (some) deep learning algorithms.

#### State-of-the-art

- Introduction to materials new from research ( $\leq$  5 years old).
- Understand some of the open questions and challenges in the field.

### **Practical**

• Fun and challenging course project.

## **Outline**

### (Tentative and subject to change!)

- Lecture 1: Fundamentals of machine learning
- Lecture 2: Neural networks
- Lecture 3: Convolutional neural networks
- Lecture 4: Training neural networks
- Lecture 5: Recurrent neural networks
- Lecture 6: Differentiable inference and generative models (part 1)
- Lecture 7: Differentiable inference and generative models (part 2)
- Lecture 8: Bayesian deep learning
- Lecture 9: Theory of deep learning
- Lecture 10: Applications

# **Projects**

### Reading assignment

Read, summarize and criticize a major scientific paper in deep learning. (Paper to be announced later.)

#### **ARTICLE**

#### Mastering the game of Go with deep neural networks and tree search

David Silver1\*, Aja Huang1\*, Chris J. Maddison1, Arthur Guez1, Laurent Sifre1, George van den Driessche1 David Silver, "An Hang", "Channis Antonoglou", Veda Panneershelvam", Marc Lanctot', Sander Dieleman', Dominik Grewe', John Nham<sup>2</sup>, Nal Kalchbrenner', Ilya Sutskever<sup>2</sup>, Timothy Lillicrap<sup>1</sup>, Madeleine Leach<sup>1</sup>, Koray Kavukcuoglu', Thore Graepel1 & Demis Hassabis1

The game of Go has long been viewed as the most challenging of classic games for artificial intelligence owing to its enormous search space and the difficulty of evaluating board positions and moves. Here we introduce a new approach to compate Go that tasks "value networks' to evaluate board positions and policy networks' to select moves. These deep learning from games of self-play. Without any lookahead search, the neural networks play Go at the level of state-of-the- art Monte Carlo free search programs that simulate thousands of randon game of self-play. We also introduce a new search algorithms that combines Monte Carlo simulation with value and policy networks. Using this search algorithms comprogram Aphilato achieved as Pas's winning rate against other Go programs, and defeated the human European Go champton by 5 games to 0. This is the first time that a compater program had defeated the human European Go champton by 5 games to 0. This is the first time that a compater program had defeated the human European Go champton by 6 Go, a feat previously thought to be a least a decade away.

All games of perfect information have an optimal value function, r'(t), which determines the outcome of the game, from every board position or states, under perfect play by all pairs, these games may be sold as features.

Recently, (e.e., convocational neural networks have achieved unprecontaining approximate) by possible sequence of mores, where the containing approximate by possible sequence of mores, where t and the production of the sequence of mores, where t and especialty (20 (20% 2.50, de 20.50), "exhibitive seators in institution", some implies a similar around center of the gains of cut, we pain in the round First, the depth of the search may be related by position evidence by consistent of the consistence of the position. We use these resum alternations to reduce from states. This approach has led to superhuman performance in cheer', checker' and colorfely. In the work believed to be intractable of the states of the color of the color of the color of the color of the states. This approach has led to superhuman performance in cheer', checker' and colorfely that two shellowed to be intractable of states of the color of the color of the states of the color of the color of the states of the color of the search tree evaluating positions using a polytical consisting of several states of the metural networks as using a pipeline consisting of several states of the color of the color of the states of the color of the color of the states of the color of the color of the states of states o chee', cacker an condiere', cacker and condiere', cacker and cacker an

Monte Carlo tree search (MCTS)<sup>1,1,1</sup> uses Monte Carlo rolloust to estimate the value of each state in a search tree. A more after than the continuation are executed, the search tree grows larger and the relevant search is also improved over time, by elsecting children with legislation and the continuation of the continuatio

the game's breadth (number of legal moves per position) and d is its layers of neurons, each arranged in overlapping tiles, to construct depth (game length). In large games, such as chose (8 = 33, 4 = 800) and increasingly abstract, localized representations of an image." where especially 60 (6 = 250, d = 150), exhaustive search is infeasible.") but employ a similar architecture for the game of Co. We pass in the board

## **Project**

Ambitious project of your choosing. Details to be announced soon.

# **Evaluation**

- Exam (50%)
- Reading assignment (10%)
- Project (40%)

The reading assignment and the project are mandatory for presenting the exam.

Let's start!
